

SEIFRIZII BAMBOO PALM

Originates from Mexico

LIGHT

Thrives in low indoor light but can tolerate some sunlight if acclimated.

WATER

Keep evenly moist but not consistently wet. Allow 1” to dry to the touch then water thoroughly so water runs out the bottom of the pot. Remove any water from saucer.

FACTS

As the old fronds die, these should be trimmed off and the leaf bases or sheath allowed to dry out. Later these should be removed as this promotes good plant hygiene and exposes the attractive light green “bamboo stem”. Very easy to grow and maintain. As with most palms, the soil should be well drained.

Applying household fertilizer in the summer months will keep these palms green and healthy.
